

Termination: fit shunt only at a bus endpoint: JP connects CAN_H to host TERM (internal 120R).

DE9: 2=L, 7=H, 3/6=GND, 5/shell=SHIELD; 1/4/8/9 open. No power on pin 9.

AUX power links ship open. AUX is unbuffered: not 24V tolerant. Reserved pins require carrier-specific verification.

P1/P2: isolated prototype pads. TP1/TP2 power is JP5/JP6-gated. FSI_EXT_GPIO1 is not a Linux GPIO.

J47 bus-side signals; passive TVS protection, no galvanic isolation
Not released: prototype mating, sourcing and bench qualification pending
